The application has been amended as follows:

- **Please replace claim 1 with:**

*(Currently Amended): Claim 1: A method for providing a time stamp by using a tamper-proof time signal via a telecommunications network comprising the steps of:*

*receiving, at a central system, a request from one of a plurality of network users for a time signal, the central system comprising a plurality of clock systems, wherein each of the plurality of clock systems of the central system is uniquely assigned to one of the plurality of network users, the request including an identifier uniquely assigned to the network user;*

*identifying, by the central system based on the received identifier uniquely assigned to the network user, one of the plurality of clock systems thereof uniquely assigned to the network user;*

*encrypting said time signal by the central system with at least one key obtained from the clock system uniquely assigned to the network user;*

*transmitting the encrypted time signal to the one of the plurality of network user assigned to the identified clock system via the telecommunications network; and*

*synchronously creating the at least one key by the clock system of the central system uniquely assigned to the network user and a clock system of the network user corresponding to the uniquely assigned clock system of the central system; and*

*determining, by the central system, a location of the network user based on the identifier uniquely assigned to the network user.*

- ***Please replace claim 4 with;***

*(Currently Amended) Claim 4: The method as recited in claim 1, further comprising the steps of:*

*determining, by the central system, the clock system uniquely assigned to the network user using ~~a transmitted~~ the identifier uniquely assigned to the*

network user, wherein the ~~transmitted~~ identifier is the network address of the network user.

• **Please replace claim 9 with:**

(Currently Amended) Claim 9: A system for generating a tamper-proof time stamp in network-based communication systems, the system comprising:

a central system connected to the network-based communication system, the central system comprising a plurality of clock systems; and

a plurality of network users connected to the network-based communication system, each of the plurality of network users comprises a clock system, wherein each of the clock systems at the central system is uniquely assigned to one of the plurality of network users,

wherein the clock system of each network user and the respective clock system of the central system are configured to operate synchronously so as to create at least one changeable key,

wherein the central system is configured to receive a request from one of the plurality of network users and encrypt a time signal using the at least one changeable key obtained from one of the plurality of clock systems uniquely assigned to the network user, the request including an identifier uniquely assigned to the network user, the central system further configured to send the encrypted time signal to the network user, and further configured to identify, based on the received identifier uniquely assigned to the network

*user, one of the plurality of clock systems thereof uniquely assigned to the network user, the central system further configured to determine a location of the network user based on the identifier uniquely assigned to the network user; and*

*wherein the network user is configured to decrypt the encrypted time signal.*

- ***Please replace claim 18 with:***

*(Currently Amended) Claim 18: The method as recited in claim 4, wherein the at least one key is created by the uniquely assigned clock system based on the ~~transmitted~~ identifier uniquely assigned to the network user.*
